

DIY Standard Size Terrarium Care

Remove the plants from the plastic bag (keeping the plants in the plastic pot) and place at the base of the terrarium. Carefully add one of the bags of gravel to the bottom of the terrarium and spread it out evenly, holding the plant pot in place as you do so. Repeat with the second bag of gravel, creating layered effect. Lastly place ornamental items in your preferred position in the gravel.

Trio of Succulents

The plants require indirect sunlight and require watering every 2 weeks approximately during summer months and every 4 weeks during the winter.

Never water the soil when it is still damp from the previous water. The succulent leaves and stems retain water so they have excess reserves if necessary.

Trio of Cacti

Cacti require very little maintenance. Ideally cacti should be watered when the soil is completely dry, when this happens, give your cacti a 'drink' of water.

Please ensure you water the base of the plants not the plant itself. Cacti enjoy being in sunlight.

Expect your cacti to go through a dormant phase in the winter and require less water.
