

Supersize Terrarium Care

Your plants arrive in plastic bags and tissue to ensure no damage occurs to the plants during shipping. Please take care in removing the packaging to ensure no damage occurs to the plants.

Please arrange the plants into the reindeer moss. We recommend placing the tallest plant at the back of the terrarium.

The reindeer moss is preserved and requires no watering.

Succulents

The succulents contained in your terrarium require bright indirect sunlight. Our plants do not like water on their leaves. Please water the base of the plant. Never water the soil if it is still damp from previous watering. Instead allow the soil to completely dry out between 'drinks.' We would expect the plants to require approximately every 2 weeks in warmer weather and every 4 weeks in winter.

Cacti

The cacti contained in your terrarium require very little maintenance. Ideally cacti should be watered when the soil is completely dry, when this happens, give your cacti a big 'drink' of water. Cacti enjoy being in sunlight. Expect your cacti to go through a dormant phase in the winter and require less water.
